

NEUROVISION BALANCE + OKN SELF-TEST

A quick way to check how your eyes, brain, and balance system work together.

Most athletes think vision is just about seeing clearly.

But performance actually depends on **three systems working together**:

- **Visual system** (eyes tracking motion)
- **Vestibular system** (balance and inner ear)
- **Proprioception** (body awareness)

When these systems communicate well, athletes react faster, stabilize quicker, and make better decisions under pressure.

This quick self-test challenges those systems using **Optokinetic (OKN) motion**, which stimulates the brain's motion-processing pathways.

Step-by-Step Test

You will perform the test **three times** while watching the OKN motion video.

Important:

Stand somewhere safe where you will not fall.

Step 1 — Right Foot Balance

1. Stand upright.
2. Lift your **right foot off the ground**.
3. Balance only on your **left leg**.
4. Start the OKN video.
5. Look at the **side-to-side moving stripes**.

Keep your:

- head still
- eyes on the moving pattern
- body relaxed

Then switch to watching the **up and down moving stripes** in the video. Lower your foot and rest.

Step 2 — Left Foot Balance

Now repeat the exact same process on the opposite side.

1. Lift your **left foot off the ground**.
2. Balance on your **right leg**.
3. Watch the **side-to-side stripes** first.
4. Then watch the **up and down stripes**.

Again perform each direction.

Step 3 — Quick Self-Check

After finishing the test, take a moment and notice how your body felt.

Answer the questions below.

Balance

Did you notice:

- wobbling or losing balance
 - one side much harder than the other
-

Eyes

Did you notice:

- eye fatigue
 - difficulty keeping your eyes on the motion
 - eyes wanting to look away
-

Vestibular (Inner Ear)

Did you notice:

- dizziness
 - disorientation
 - motion sensitivity
-

Brain / Focus

Did you notice:

- mental overload
 - difficulty concentrating
 - feeling “off” during the movement
-

What This Means

Your brain constantly integrates **visual motion + balance signals**.

If this system is inefficient, athletes may experience:

- slower reactions
- poor balance under pressure
- motion sensitivity
- delayed decision making

Training the **visual–vestibular system** can improve how quickly the brain stabilizes and processes movement.

This is why elite athletes train their **visual brain**, not just their body.

Want to Know Where Your Brain is Really At?

This quick test is only a small glimpse.

In our **NeuroVision Performance Evaluation**, we measure:

- reaction speed
- peripheral awareness
- eye tracking
- visual processing
- decision speed

So we can identify exactly **what is limiting performance**.

Train the brain.

Train the eyes.

Train the edge.
