FREE 7 DAY TRIAL / CRICKET BATTING

THE PREDICTION TRIAL

Seven days of structured work on the one thing the best batters do differently with their eyes. You watch the release, you jump ahead, you wait, you read. Same eyes, different software.

DAILY DOSE

**15 to 20
minutes**

TRAINING DAYS

**5 of 7
plus a retest**

EQUIPMENT

**A ball, a wall,
a partner**

YOU MEASURE

**Day 1 baseline
Day 7 retest**

AAKASH SHAH, O.D., FOVDRA • SHAH NEUROVISION CENTER • MEASURE. SHARPEN. DOMINATE.

You were told to watch the ball. Nobody told you where to put your eyes.

Keeping your eye on the ball is the most repeated instruction in cricket and the least specific. It tells you what to care about. It does not tell you what your eyes should actually do in the half second you have. This week gives you the sequence, a way to measure yourself at the start and the end, and five sessions of work in between.

WHAT THIS TRIAL IS

- **A visual skills block, not a batting lesson.** Nothing here replaces net sessions, throwdowns or your coach. It sits on top of them.
- **Five working days and two lighter ones.** The eyes adapt on the days you do not load them. Day 5 is a reset, not a missed session.
- **15 to 20 minutes a day.** If a session is taking you 40 minutes you have added something. Take it back out.
- **Never on a match day.** If a game lands mid-week, that day is a rest day and the week runs to eight.
- **Every day ends with a number.** A rep count, a call score, a time. If you do not write it down, you have done a workout, not a protocol.

WHAT YOU NEED

- A tennis ball or a Marsden ball on a string. Any tossed ball works.
- A wall you are allowed to throw against.
- A partner for three of the five sessions. A parent, a teammate, anyone.
- Tape or three cones to mark lengths on the floor.
- A phone that shoots slow motion.
- This guide, printed, and a pen.

WHAT YOU DO NOT NEED

Strobe glasses. An app subscription. A machine. None of the seven days needs equipment you have to buy. That is deliberate. The work is the point, not the kit.

BEFORE YOU READ ANOTHER PAGE

If the ball is blurry out of the hand, none of this fixes that. Blur is an optical problem with an optical answer. Get a full eye exam first so that anything you build sits on top of the right prescription. Nothing in this guide is a diagnosis or a treatment. It is training.

THE WEEK AT A GLANCE

DAY 1	DAY 2	DAY 3	DAY 4	DAY 5	DAY 6	DAY 7
Baseline	The release window	The first jump	The wait	Reset and review	The second jump	Retest
20 min	18 min	18 min	18 min	10 min	20 min	20 min

A fast delivery gives you about **half a second**. Your pursuit system is not built for it.

Two systems move your eyes. Smooth pursuit glides them along a moving target and stays accurate to roughly 30 degrees per second, after which it breaks into catch-up jumps. Saccades are the jumps themselves, and they peak in the hundreds of degrees per second. In the last few metres before the bat, a quick delivery sweeps across your field far faster than pursuit can hold. Following it all the way is not a discipline problem. It is a hardware limit.

ONE DELIVERY, MAPPED

A working map of a quick delivery, not a fixed rule. Timings stretch with slower pace and a fuller length. The order of the four beats stays the same.

TWO SYSTEMS, TWO SPEEDS

SMOOTH PURSUIT, ACCURATE TO ABOUT

30 DEGREES PER SECOND

A SACCADPE PEAKS AROUND

500 DEGREES PER SECOND

Drawn to scale. Peak speed rises with the size of the jump. This is why the jump is the only tool fast enough for the back half of the delivery.

THE POINT

Amateurs try to hold the ball with pursuit and end up a beat late. Better batters spend pursuit where it is cheap, at release, then buy the rest of the delivery with one jump.

WHERE THIS SHOWS UP AT THE CREASE

The late beat

Being beaten by a good length ball can be a late jump, not a late trigger movement.

The length you missed

The drive at a ball that was not there is a length call. Length is called before the bounce or not at all.

The one that seamed

Eyes still chasing get no warning off the seam. Parked eyes get the first frame of it.

Every drill this week belongs to one of these four beats.

Before you start a session, know which beat you are loading. That is the difference between a protocol and a pile of eye exercises.

01

Watch the release

DAY 2

What it is. Pursuit, for the first tenth of a second. The only window where following the ball is cheap and useful.

What you collect. Wrist, seam, arm speed, release height, the angle it leaves on. Everything the jump is aimed with comes from here.

02

Jump ahead

DAY 3

What it is. One saccade to where you expect the ball to pitch. Your eyes arrive before the ball does.

Why it matters. Across batters of different standards, a short latency on that first jump was what separated the good from the poor.

03

Wait

DAY 4

What it is. A still fixation on the bounce point while the ball closes. It is the hardest beat to hold.

What is working. Side vision keeps updating the trajectory while the eyes stay parked. You are not blind in the wait, you are budgeting.

04

Read and go again

DAY 6

What it is. Follow the ball off the pitch, and in the best batters, a second jump forward to where bat meets ball.

The head. The two international batters measured doing this turned their heads with the ball, keeping it in a steady direction relative to the head.

SAME DELIVERY, TWO STRATEGIES

BEAT	AMATEUR PATTERN	PATTERN IN BETTER BATTERS
Watch	Stares at the hand and holds on too long.	Takes a short, specific look, then lets go.
Jump	Late, small, or does not happen at all.	Early, committed, aimed at a length.
Wait	Keeps chasing. Catch-up jumps stack up.	Eyes still. Side vision updates.
Read	Arrives with the ball, plays behind it.	Arrives first, plays through it.

HONEST LINE

This describes what better batters do. It does not prove that copying it makes you one. The two cricket gaze studies behind it measured three batsmen and two batters, enough to describe a strategy and not to promise a result. Nobody has shown that eye work raises a batting average. Train it because the strategy is sound and measurable.

Every session is the **same shape**. Only the middle block changes.

Learn this once and you will not have to re-read the structure on any of the seven days.

Five minutes of warm-up, seven minutes of the day's work, seven minutes of NeuroVision training.

THE WARM-UP WINDOW / 5 MINUTES, UNCHANGED EVERY DAY

01	02	03	04
Near to far	Column jumps	Figure of eight	Stance and reset
60 SEC	60 SEC	60 SEC	60 SEC
Small print at arm's length, a target six metres away. One word near, one detail far. Both ends must come clear.	Two marks at eye height, a shoulder width apart, from three metres. Head still. Count clean landings.	Marsden ball, a ball on a string, or your thumb. A slow lazy eight. The one place all week you train pursuit on purpose.	Into your stance. Chin over the front shoulder, eyes level, ten slow blinks. Then set up for the work.

THE DOSE

Daily block	15 to 20 minutes. Never 40.
Training days	Five, plus a reset and a retest.
Match days	None. Push the week out a day.
Time of day	Pick one and keep it.
Order	Warm-up, then the work, then the NeuroVision block. Never reversed.
Recording	Write the number down the moment the block ends, not later.

STOPPING RULES

Stop the session, not just the drill, if you get any of these:

- Headache behind or around the eyes
- Double vision, or letters sliding apart
- Nausea or dizziness
- Eye strain that is still there the next morning

Come back the next day at half the reps. If it happens twice, stop the trial and speak to an eye care professional. If you have had a concussion in the last six weeks, clear this with a clinician first. Under 18, a parent should know you are doing this.

SETTING UP THE THREE LINES / YOU WILL USE THESE ON DAYS 1, 3, 6 AND 7

THREE LINES, EIGHT METRES

- Tape or chalk, indoors or out. Three lines across the throwing path.
- Measuring back from you: **full** at about 1.5 m, **good** at 3 m, **short** at 4.5 m.
- On a full-length surface use real lengths, keeping the gaps even. Photograph the setup so Day 7 is identical to Day 1.

DAY

01

Measure first. Train nothing.

Five tests, five numbers, twenty minutes. Today you find out where you are.

BLOCK

20 MIN

Nobody at the professional level guesses this. We baseline in preseason and retest six weeks later, and you are doing a small version of that in a week. Run the warm-up window first, then these five tests in order, with your partner recording the scores.

TEST 1

4 MIN

The release read

Partner throws underarm from eight metres showing one, two or three fingers at release. Call the number before the ball has travelled two metres. Twenty balls. **Score out of 20.**

TEST 2

5 MIN

The length call

Using the three lines from page 5, your partner bounces the ball on one of them in no pattern. Call the length out loud **before it lands**. Twenty balls. **Score out of 20.**

TEST 3

2 MIN

Near to far switches

Small print at arm's length, a target six metres away. Sixty seconds. Count only switches where both ends came properly clear. **Score is the count.**

TEST 4

2 MIN

Eyes and hands

Partner tosses left and right at random from four metres. One-handed catches, same hand as the side. Sixty seconds. **Score is clean catches.**

TEST 5

5 MIN

Head on line

Phone on a stand, slow motion on, ten throws in your stance. Count the deliveries where your head turned with the ball and stayed on line. **Score out of 10.**

TODAY'S RULE Do not train after the tests. Copy the five numbers to the log on page 13, photograph your line setup and note the time of day. Day 7 has to match it.

WRITE THE FIVE NUMBERS HERE BEFORE YOU LEAVE THE GROUND

TEST	SCORE	OUT OF	WHAT MADE IT HARD TODAY
1. Release read		20	
2. Length call		20	
3. Near to far switches		60 sec	
4. Clean catches		60 sec	
5. Head on line		10	

DAY

02

The release window

One look at the hand, taken early and let go of. Not a stare.

BLOCK

18 MIN

WHY THIS BEAT FIRST

Everything the jump is aimed with is collected in roughly the first tenth of a second after the ball leaves the hand. Wrist position, seam, arm speed, release height. If that look is late or vague, the jump that follows is a guess, and a guess is why the ball seems to do something after it pitches.

AT THE CREASE

Situations where a slow release read could show up. Not a description of how you bat, but where to look. Spin read off the pitch rather than the hand. The slower ball that registers halfway down. The wrong 'un picked a beat late.

WARM-UP

5 MIN

The warm-up window

Four steps, unchanged, from page 5. Do not skip the figure of eight.

THE WORK

7 MIN

Read the hand, three sets of fifteen

- **Set 1.** Partner throws from eight metres showing one, two or three fingers at release. You call the number, then catch the ball. Calling comes first.
- **Set 2.** Same, but the partner keeps the ball hidden behind the hip until the last moment. The window gets shorter.
- **Set 3.** Same as set 2, but you call the number and the side the ball will pass you on. Two pieces of information from one look.

NEUROVISION

7 MIN

Jump machinery

Column jumps at three metres for 90 seconds, then at six metres for 90 seconds, counting clean landings. Then near to far switches for 90 seconds, and 90 seconds of figure of eight. Head still throughout. If your head is moving, you are cheating the jump with your neck.

CUE

One look, then let go. If you are still staring at the hand when the ball is halfway down, you have spent the whole budget on the cheap part.

HARDER / EASIER

Harder. Partner throws from ten metres, or from behind a screen they step out of.

Easier. Six metres, and they hold the fingers up for a full second before release.

Log today. Correct calls out of 45, and which set was hardest.

IF THE RELEASE READ IS NOT MOVING

You are guessing

Scores near chance mean the look is too late. Hold the fingers up a beat longer, then shorten again.

You are staring

Right calls, but you lose the ball afterwards. Take the look and let it go.

You are waiting

You call it once the ball is halfway down. Make a late call count for nothing.

DAY

03

The first jump

Call a length, then move your eyes to it and leave them there.

BLOCK

18 MIN

WHY THIS IS THE ONE THAT MATTERS

When batters of different standards were compared, what separated good from poor was how quickly that first jump was launched. Not accuracy, not how long they tracked. The latency. A jump that leaves early lands early, and eyes already at the pitch have time to read what happens there.

AT THE CREASE

Situations where a late jump could show up. The drive at a ball that was not full enough. The pull at one that was too full. The half-volley that looked like a length ball. The yorker dug out late rather than played. The ball that seemed to hurry on to you.

WARM-UP

5 MIN

The warm-up window

Four steps from page 5. Give the column jumps your full attention today.

THE WORK

7 MIN

Call it, jump to it, wait. Three sets of fifteen

- **Set 1.** Three taped lines on the floor. Partner throws to bounce on one of them. You call the length out loud and, on the same beat, flick your eyes to that line and hold them there until the ball arrives.
- **Set 2.** Same, but silent. The call happens in your head and only the eye movement is visible. Your partner watches your eyes and marks whether the jump landed before the ball bounced.
- **Set 3.** Same as set 2, with the partner adding a fourth option: a full toss that never bounces. The jump has to be aimed at a contact point instead.

NEUROVISION

7 MIN

The saccade ladder

Two marks at three metres, 20 clean jumps, timed. Then two marks at six metres, 20 jumps, timed. Then a three-point triangle on the wall, going round it for 60 seconds, counting laps. Finish with 60 seconds of figure of eight. Write down both times. They should shorten across the week.

CUE

Commit to the wrong length rather than float between two. A committed jump that was wrong is information. A jump you never made is nothing.

HARDER / EASIER

Harder. Move the lines closer together so the three lengths are harder to tell apart.

Easier. Two lines instead of three, and the partner throws slower.

Log today. Correct calls out of 45, jumps that landed before the bounce out of 30, and both ladder times.

IF THE JUMP IS NOT HAPPENING

It never leaves

Go back to calling the length out loud. The voice drags the eyes with it.

It leaves late

Slow the throw until the jump is early, then rebuild the speed.

It floats between lengths

Two lines instead of three until every ball gets a call.

DAY
04

The wait

Eyes parked, ball closing, side vision doing the updating.

BLOCK
18 MIN

WHY THIS FEELS WRONG AND IS RIGHT

Holding your eyes still while a ball comes at you goes against everything your reflexes want. The reason it works is that you are not blind during the wait. Information is still arriving through side vision and it keeps updating where the ball is going. The wait is not a gap in the process. It is the part that buys you the time to play a shot.

AT THE CREASE

Situations where a broken wait could show up. Movement off the seam that arrives with no warning. The ball that keeps low and is played from memory. A bouncer watched all the way and then lost. Late swing that registers only after you have committed.

WARM-UP

5 MIN

The warm-up window

Four steps from page 5. Add ten extra seconds to the stance reset today.

THE WORK

7 MIN

Hold the fixation. Three sets of twelve, then the bounce hold

- **Peripheral catch.** Mark an X on a wall at eye height, stand three metres back, eyes locked on it. Partner tosses a ball into your side vision from the left or right. Catch it without your eyes leaving the X. Six each side, three sets. If your eyes move, that rep does not count.
- **Bounce hold.** One taped line. Partner throws to bounce on it. Your eyes go to the line early and stay there until the ball actually arrives, then follow it up off the pitch. Fifteen balls. Your partner watches your eyes, not the ball.

NEUROVISION

7 MIN

Fixation stability

Four holds of 30 seconds on a small target at six metres, with 30 seconds of figure of eight between each one. During the holds, keep naming things you can see in side vision without moving your eyes. That is the skill: a still centre and a working edge. Finish with 60 seconds of near to far.

CUE

The wait feels like doing nothing. It is the work. Let the ball come to your eyes instead of sending your eyes after the ball.

HARDER / EASIER

Harder. Partner tosses from further back in your side vision, or calls a number you must repeat while holding.

Easier. Start the toss closer to centre and widen it over the sets.

Log today. Clean catches out of 36, holds broken out of 15.

IF THE WAIT KEEPS BREAKING

The flinch

Eyes snap back to the ball. Soften and slow the toss, then rebuild the speed.

The blink

You lose the first frame off the pitch. Blink deliberately between balls instead.

The drift

Eyes hold but the head creeps forward. Film it. You will not feel it happening.

DAY
05

Reset and review

A light day is part of the dose. Skipping it is not toughness.

BLOCK
10 MIN

WARM-UP
5 MIN

The warm-up window, and nothing after it

Four steps from page 5, done properly and slowly. No sets, no partner, no counting against the clock. Three days of loaded jumps and held fixations need a day where the system runs without being pushed.

REVIEW
5 MIN

Read your own numbers back

Open the log. Answer these four in writing, in one line each. This is the part that makes Day 6 worth doing.

- 1 Which beat felt worst: watching the release, launching the jump, or holding the wait?
- 2 Where did your scores move between Day 2 and Day 4, and where did they sit still?
- 3 Did anything hurt, strain or feel off? If yes, Day 6 runs at half reps.
- 4 What is the one thing you will do differently on Day 6?

HOW TO READ A SCORE HONESTLY

A move of one or two is noise

On a test out of 20, a two-point swing is normal variation. Not progress, not decline.

Direction beats size

Three sessions moving the same way matters more than one big jump. Look at the shape.

Flat is a normal result

Five sessions is a first look. Flat after a week tells you nothing about week six.

TODAY'S RULE If you feel fine and want to train anyway, do not. The reset is the reason Day 6 and Day 7 are worth measuring.

RATE EACH BEAT OUT OF FIVE, FROM WHAT YOU HAVE SEEN IN FOUR DAYS

BEAT	A 1 OR 2 LOOKS LIKE	A 4 OR 5 LOOKS LIKE	YOUR SCORE
1. Watch the release	Still looking at the hand when the ball is halfway down.	One look, information taken, then you move on.	
2. Jump ahead	No jump, or one that arrives with the ball.	It leaves early and lands on a committed length.	
3. Wait	Eyes chase. Catch-up jumps stack up late.	Eyes still, side vision working, no urge to chase.	
4. Read and go again	Head falls away late and you arrive behind the ball.	Head turns with the ball, eyes are there at contact.	

Your lowest beat is the one to bring to Day 6.

DAY

06

The second jump, and the head

Bounce to contact, with the head turning and the eyes doing the jumping.

BLOCK

20 MIN

WHAT THE MEASUREMENTS SHOWED

When two international-level batters were filmed with eyes and head tracked, two things stood out. They rotated the head with the ball, keeping it in a steady direction relative to the head. And they usually made a second jump, from the bounce to where bat would meet ball, so their gaze was on the ball at contact. The head tracks. The eyes predict.

AT THE CREASE

Situations where a missing second jump could show up. The inside edge onto the pad. The caught-and-bowled chance that beats your hands. The ball played at rather than through. The shot where your head fell away at the last moment.

WARM-UP

5 MIN

The warm-up window

Four steps from page 5. If Day 5's review flagged strain, halve every rep today.

THE WORK

7 MIN

Two markers, three sets of fifteen

Tape a bounce line and a second mark where you would meet the ball. One delivery now has a four-beat sequence: look at the hand, jump to the bounce line, hold until the ball gets there, then jump forward to the contact mark and play the shot. Your partner throws to bounce on the line and calls out any rep where they saw your eyes chase the ball instead of jumping ahead of it.

NEUROVISION

8 MIN

Head coupling, on camera

Phone on a stand, slow motion on, ten throws in your stance. Watch it back twice against the four checks below and note your score out of ten. Then take ten more throws trying to fix the single thing you saw.

CUE

The head turns with the ball. The eyes do the jumping. If your head is still and your eyes are swinging, you have it backwards.

HARDER / EASIER

Harder. Partner varies the length so the bounce line moves, and you have to aim both jumps fresh each ball.

Easier. Drop the contact mark and run the first three beats only.

Log today. Reps where both jumps landed out of 45, head on line out of 10.

WHAT TO LOOK FOR WHEN YOU WATCH THE FOOTAGE BACK

01

At release

HEAD STILL

Want: head level, eyes up, nose toward the hand.

Not: head already drifting off before the ball is out.

02

Top of back-lift

CHIN OVER SHOULDER

Want: chin over the front shoulder, both eyes on the ball.

Not: chin tucked in, front eye blocked by the nose.

03

As it pitches

ONE SMOOTH TURN

Want: head turning down with the ball in one move.

Not: a late snap to catch up with where it already is.

04

At contact

HEAD OVER THE BALL

Want: head over the ball, eyes still down.

Not: head falling to the leg side, eyes up the ground.

DAY
07**Retest. Same tests, same order.**

Change only counts if nothing else changed. Keep the conditions identical.

BLOCK
20 MIN**KEEP THESE FOUR THE SAME AS DAY 1**

- **Time of day.** Within an hour of when you did the baseline.
- **Partner.** The same person, throwing from the same distance.
- **Order.** Tests one to five, exactly as on Day 1.
- **Warm-up.** Run the full five minutes first, as you did on Day 1.

RETEST

18 MIN

The five tests again

Release read out of 20. Length call out of 20. Near to far switches in 60 seconds. Clean catches in 60 seconds. Head on line out of 10. Full instructions are on page 6. Write the new numbers in the second column of the log, next to the old ones.

READ IT

2 MIN

What your two columns actually mean

- **The length call is the one to watch.** It is the closest test to the jump itself, and the one most likely to move in a week.
- **One or two points is noise.** Do not build a story on it in either direction.
- **Four or more on the same test, in the same direction, is worth following.** Not proof. A signal worth a longer block.
- **Flat across all five is a normal seven-day result.** The tests that move fastest are the ones you practised most, and five sessions is not much practice.
- **If the release read got worse, check your sleep and your load.** Tired eyes test badly and that is information too.

HONEST LINE

Whatever those two columns say, they are drill scores, not match scores. Getting better at a test is the easy half. Carrying it into the middle against a bowler who is trying to work you out is the hard half, and it is measured in months rather than days. Anyone promising you a number off a week of eye work is selling you something.

THREE WAYS THIS WEEK CAN END, AND WHAT EACH ONE MEANS**The length call moved**

The most likely result, and the most useful. The jump is the trainable beat and it responds fastest. Keep the three lines up and keep going.

Everything sat still

Normal. Five sessions is a first look. The value this week was the baseline and finding your weakest beat, and you have both of those.

Something got worse

Check load, sleep and whether you trained on a match day. If a test dropped by more than four and you had strain or headaches, book an eye exam before you do any more.

Write it down the **moment the block ends.**

Numbers written an hour later are numbers you have adjusted. Fill this in with a pen, at the ground or in the garden, before you do anything else.

BASELINE AND RETEST

TEST	DAY 1	DAY 7	CHANGE
Release read (out of 20)			
Length call (out of 20)			
Near to far switches (60 sec)			
Clean catches (60 sec)			
Head on line (out of 10)			

DAILY SESSIONS

DAY	MAIN SCORE	LADDER TIME / REPS	HOW IT FELT, IN ONE LINE
Day 2			
Day 3			
Day 4			
Day 5			
Day 6			

THE WORST BEAT THIS WEEK WAS

ANYTHING THAT HURT, STRAINED OR FELT OFF

NAME

AGE AND LEVEL

WEEK STARTING

TIME OF DAY USED

Seven days shows you the sequence.

Twelve weeks is where it gets built.

A trial is a trial. It is long enough to teach you the four beats, give you a baseline and show you which one you are worst at. It is not long enough to change how you see a bowler. Here is what the full block looks like, so you can decide with your eyes open.

WEEKS 1 TO 4

Foundation

The warm-up is built off your own baseline numbers rather than a template, and the daily tracking rep goes in.

WEEKS 5 TO 8

Integration

The decision layer is added, so the eyes are working while the feet and hands have to do something about it.

WEEKS 9 TO 12

Transfer

The work moves toward the nets and the middle, and a full retest closes the block at week twelve.

HOW IT RUNS	
Dose	15 to 20 minutes a day, four to five days a week, never on a match day.
Inside the block	Neural warm-up, then the cognitive-motor tool of the day, then the NeuroVision training sequence.
Contact	One session a week with the training team, on Zoom if you are remote.
Measurement	Baseline at the start, retest at week twelve, with checkpoints in between.
Season	Built around your calendar, with an in-season version and an off-season block.

FOR COACHES AND STAFF

At the professional level we do not guess this. We test it. Baseline in preseason, retest in six weeks, and the warm-up is built off the athlete's numbers rather than a template.

If you are a strength and conditioning coach, physio or performance director and you want to see what we actually test, and what a squad-level baseline and return-to-play protocol looks like, send us a message with the word **PRO** and we will send the testing outline rather than the athlete version.

TWO WAYS TO CARRY ON

Self-guided, or coached

NeuroVision Edge is the digital route. Twenty-six weeks of structured work, the full drill library and the progressions this week only sampled, with optional one-to-one time with Dr. Shah. Full details on the last page.

The coached block is the route above: testing at the center, a warm-up built off your own numbers, and a weekly session with the training team.

BRING THESE EITHER WAY

- Your most recent full eye exam, so anything you build sits on the right prescription.
- Your Day 1 and Day 7 columns. They become the first two points on your chart.
- Your level, your position and who you struggle against. The drills change with all three.

What this is built on, and what it **does not claim**.

You were given a protocol and told to measure it. You are owed the reasoning and the limits behind it.

WHERE THE FOUR BEATS COME FROM

- Land, M. F. and McLeod, P. (2000). From eye movements to actions: how batsmen hit the ball. *Nature Neuroscience*, 3(12), 1340 to 1345. Three batsmen of different standards. Their eyes watched the release, made a predictive jump to the expected bounce, waited, then followed the ball for 100 to 200 milliseconds after it pitched. A short latency on that first jump separated the good batsmen from the poor ones.
- Mann, D. L., Spratford, W. and Abernethy, B. (2013). The head tracks and gaze predicts: how the world's best batters hit a ball. *PLOS ONE*, 8(3), e58289. Two international-level batters. They coupled head rotation to the ball and usually made two predictive jumps, one to the bounce and one to bat-ball contact.
- Vater, C. and colleagues (2022). Whether predictive saccades are linked to processing peripheral information. *Psychological Research*. The basis for treating the wait as an active beat rather than a gap.

WHAT THIS GUIDE DOES NOT CLAIM

- That this training raises a batting average, a strike rate or any cricket statistic. The study most often cited for it had no control group.
- That strobe training improves decision making. The 2025 meta-analysis found an effect on reaction time only, which is why no strobe work appears anywhere in these seven days.
- That better athletes have better eyes. A 2025 study found the control group had the sharpest acuity of anyone measured.
- That two studies of five batsmen between them prove anything about you. They describe a strategy well enough to be worth training and measuring. That is the argument.

MEDICAL NOTE

This guide is general training information. It is not a diagnosis, a treatment or a substitute for an eye examination, and nothing in it is prescribed for you personally. If the ball looks blurry out of the hand, if you get headaches or double vision while you read or bat, or if you have had a concussion in the last six weeks, see an eye care professional before you train. Dr. Shah is an optometrist with a fellowship in vision development. Athletes under 18 should have a parent or guardian read this page.

WHAT SEVEN DAYS CAN AND CANNOT TELL YOU

WHAT YOU NOW HAVE

- A baseline and retest on five tests under the same conditions.
- The four beats, and which one is your weakest.
- A warm-up you can run before any session, for good.

WHAT YOU DO NOT HAVE YET

- Enough sessions to change anything durable. Five is a sample.
- Progressions. Every drill here sits at one difficulty.
- Transfer work. Nothing this week faced a live bowler.

SHAH
NEUROVISION
CENTER

VISION • BRAIN • PERFORMANCE

DAY 8 AND EVERYTHING AFTER IT

NEUROVISION EDGE

The digital program built on the Shah NeuroVision Method. Twenty-six weeks of structured work on reaction time and anticipation, with the full drill library, the progressions this week only sampled, and optional one-to-one time with Dr. Shah.

WHAT CARRIES ON FROM THIS WEEK

- All four beats trained across a full block instead of one session each.
- Every drill in this guide with its progressions and stopping rules, plus the ones that did not fit in seven days.
- The warm-up sequence, built out properly rather than cut to four steps.
- Tracking that carries your Day 1 and Day 7 numbers forward as the first two points.
- Optional one-to-one work with Dr. Shah when you want eyes on your numbers.

neurovisionedge.lovable.app

Scan the code or type the address. Program details, what is included and current pricing are all on the site.

ATHLETES AND PARENTS

Comment **TRAIN** on the reel

We will send the trial and point you to the right starting block. One condition, and we do ask: run the week and send your log back.

COACHES AND STAFF

Message **PRO**

For strength and conditioning coaches, physios and performance directors. We will send the squad testing outline rather than the athlete version.

NeuroVision Edge is training, not treatment, and nothing in it is a substitute for an eye examination. No program raises a batting average on its own, and we do not claim one does.

Aakash Shah, O.D., FOVDRA

Shah NeuroVision Center

MEASURE. SHARPEN. DOMINATE.
