

SHAH NEUROVISION · SPORTS TRAINING
LEVEL 01 · 8-WEEK PROGRESSION

QUIET EYE, QUIET BRAIN

An 8-week build that takes the Level 1 Neural Warmup from a pre-game ritual to a trained performance state — calmer gaze, quieter mind, and focus that holds when the pressure crashes everyone else's.

DURATION 8 WEEKS · DAILY **BASE** LEVEL 1 WARMUP **NEXT** LEVEL 2

By Dr. Aakash Shah, O.D., FOVDRA · Sports Vision & Neuro-Visual Performance

How This 8-Week Plan Works

Week 1 is the Level 1 Neural Warmup exactly as written — the four core drills and the 90-second ritual. It is the base everything stacks on. Each week after it adds load, motion, or pressure on top of that base, never replacing it. You run the protocol daily; neural adaptation comes from repetition, not intensity.

Two pillars, trained together

- **Quiet Eye** — the visual side: a longer, steadier final fixation, clean saccades, effortless near-far shifts, smooth pursuit, and wide peripheral awareness.
- **Quiet Brain** — the nervous-system side: the long-exhale vagal brake, lower arousal on command, and attention that holds steady under cognitive load and pressure.

Elite performance is the two pillars coupled — a quiet eye sitting on top of a quiet brain. The plan trains them in parallel so they fire together when it counts.

Three phases

- **Phase 1 · Foundation (Weeks 1–3)** — clean fixation, longer holds, and the breath brake.
- **Phase 2 · Load & Integration (Weeks 4–6)** — hold the quiet eye under cognitive load and motion, then integrate all drills into one flow.
- **Phase 3 · Pressure & Transfer (Weeks 7–8)** — inoculate against stress and transfer the routine to your sport.

The 8 Weeks at a Glance

Run the daily protocol every training session and every game. Do not advance to the next week until you can hit the current week's checkpoint.

WK	PHASE	THEME	END-OF-WEEK CHECKPOINT
1	Foundation	Establish the Base	Run the full 90s ritual from memory
2	Foundation	Lengthen the Fixation	Clean 2-second quiet-eye hold
3	Foundation	Clean Arrivals	Saccades land on-target, no overshoot
4	Load & Integ.	Quiet Brain Under Load	Fixation holds through mental math
5	Load & Integ.	Eyes in Motion	(Will be inside digital program)
6	Load & Integ.	Integration	(Will be inside digital program)
7	Pressure	Pressure Inoculation	(Will be inside digital program)
8	Pressure	Game Transfer & Readiness	(Will be inside digital program)

WEEK

01

PHASE 1 · FOUNDATION

Establish the Base**GOAL THIS WEEK**

Learn all four core drills, install the long-exhale brake, and capture your starting baselines. This week is the entire program in miniature — everything that follows stacks on it.

Drill Progression

DRILL	THIS WEEK'S PRESCRIPTION	CHANGE
Quiet Eye Focus	3–5 cycles · 4s inhale / 6–8s exhale, single small target	Baseline
Target Lock Saccades	2 × 30s · 15s rest · 2 targets 4–6 ft apart	Baseline
Near-Far Shift	2 × 20 reps · ~1 shift / sec	Baseline
Peripheral Anchor	3 × 30s · 15s rest	Baseline

QUIET-BRAIN LAYER**The long exhale is your vagal brake.**

Make the 6–8 second exhale the anchor of every drill. The slow exhale downshifts sympathetic arousal — the same system that makes the eyes jumpy under stress.

Rate your calm 1–10 at the end of each session and log it. That number is your nervous-system baseline.

NEW THIS WEEK Baseline test — time how long you can hold a clean quiet-eye fixation before the first drift. Write the number down; you will re-test it in Week 8.

CHECKPOINT You can run the full 90-second pre-game ritual from memory, no notes.

WEEK

02

PHASE 1 · FOUNDATION

Lengthen the Fixation**GOAL THIS WEEK**

Hold the quiet eye longer and cleaner, and deepen the breath brake so calm arrives faster.

Drill Progression

DRILL	THIS WEEK'S PRESCRIPTION	CHANGE
Quiet Eye Focus	5–6 cycles · push the exhale toward a full 8s	+1 cycle, longer exhale
Target Lock Saccades	2 × 40s · 15s rest	+10s per set
Near-Far Shift	2 × 25 reps	+5 reps
Peripheral Anchor	3 × 40s · 15s rest	+10s per hold

QUIET-BRAIN LAYER**Build CO₂ tolerance for a steadier system.**

Nasal breathing only this week. Add a 2-second pause at the bottom of every exhale.

That brief air-hunger trains CO₂ tolerance, which flattens your arousal response — a calmer baseline that holds up when the game speeds up.

NEW THIS WEEK Track your quiet-eye hold time each session. Target a clean 2-second fixation with no drift.

CHECKPOINT A clean 2-second quiet-eye hold, no micro-jumps.

WEEK

03

PHASE 1 · FOUNDATION

Clean Arrivals

GOAL THIS WEEK

Sharpen the snap so the gaze arrives precisely, make near-far shifts effortless, and lower resting arousal between reps.

Drill Progression

DRILL	THIS WEEK'S PRESCRIPTION	CHANGE
Quiet Eye Focus	6 cycles · full 8s exhale	Hold steady
Target Lock Saccades	3 × 30s · targets 6–8 ft apart	+1 set, wider spacing
Near-Far Shift	3 × 20 · faster crisp-lock	+1 set, faster lock
Peripheral Anchor	3 × 45s	+5s per hold

QUIET-BRAIN LAYER

Down-shift on command.

Take your pulse before and after the session; aim to finish with a lower heart rate than you started.
Take one deliberate reset breath between every drill. You are teaching the system that the gaze and the nervous system settle together.

NEW THIS WEEK Between reps, close your eyes and visualize the target sharply for 3 seconds before re-opening — mental rehearsal that strengthens the same fixation network.

CHECKPOINT Saccades land on-target with no overshoot; near-far shifts feel automatic. (End of Phase 1.)

WEEK

04

PHASE 2 · LOAD & INTEGRATION

Quiet Brain Under Load

GOAL THIS WEEK

Keep the eye quiet while the brain is busy. This is the heart of “quiet brain” — if attention can survive a working-memory load here, it will survive a defender in your face.

Drill Progression

DRILL	THIS WEEK'S PRESCRIPTION	CHANGE
Quiet Eye Focus	6 cycles while counting back from 100 by 7s	+ cognitive load
Target Lock Saccades	2 × 40s while reciting the months backward	+ cognitive load
Near-Far Shift	2 × 25 · call “near / far” aloud each shift	+ verbal load
Peripheral Anchor	3 × 45s · silently name 3 edge objects per hold	+ naming load

QUIET-BRAIN LAYER

If the gaze breaks, the load won.

Dual-task drills tax working memory while the eyes must stay still. The moment your fixation jumps, you have lost the rep — reset and start again.

This rehearses the exact failure mode of pressure: a busy brain pulling the eyes off-target.

NEW THIS WEEK A dual-task overlay is added to every core drill this week.

CHECKPOINT Fixation stays stable straight through the mental math.

The rest (Will be inside digital program) due to requiring materials and additional training. Take a look here if interested: <https://neurovisionedge.lovable.app/>

SAFETY CHECK

If anything feels off — stop.

If you experience pain, dizziness, persistent blur, double vision, or a sharp headache during any drill, stop the protocol and check in with a vision specialist. This guide is a training tool, not a medical evaluation.

Athletes recovering from concussion or with binocular vision conditions should consult Dr. Shah before running the program.
